

Fuel Systems

**Supplement Catalogue
Version 4.2**

Fuel Systems

This catalogue supplements the existing Fuel Systems catalogue. It contains new applications which further enhance the Siemen VDO brand's extensive product portfolio.

The additions cover the following areas:

- Fuel Supply Units
- Lever-Type Sensors
- Tubular-Type Sensors

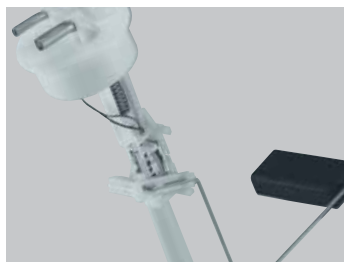

New to the range are:

- Products for use in Renault vehicles
- Significantly expanded applications for the following makes of vehicle:
 - Citroën
 - Fiat
 - Lancia
 - Peugeot

The main catalogue is available online at
<http://www.vdo.com/siemens/en/download.asp>

Fuel Pumps | Fuel Supply Units

The electric next-generation fuel pumps/fuel supply units that are installed in the tank, guarantee a permanently reliable supply of fuel to the engine. They are employed as in-tank pumps for combustion engines, with injection systems for petrol or diesel supply. A return-flow returns unused fuel to the tank.

The primary functions are:

- Fuel supply of the individual or central injection system, with specified pressure and throughput, after switch-on of the in-vehicle voltage
- System pressure retention in the fuel supply line at all operating conditions

Fuel Pumps

The fuel pump is a component of a fuel supply unit sited in the tank. Within the supply unit, the pump is sometimes installed in a swirl pot.

Fuel pumps are sometimes equipped with a filter.

Fuel Pumps with Swirl Pot

The fuel pump with swirl pot is a component of a fuel supply unit sited in the tank.

Fuel pumps with swirl pot are equipped with a filter.

Fuel Supply Units

The fuel supply unit generally consists of the fuel pump (sometimes with swirl pot), a filter and flange with corresponding connections. In addition, the supply unit can be equipped with a lever-type sensor and can be used in combination with an immersion tubular-type sensor.

Lever-Type Sensors

Fuel Level Sensors

The measurement of the fuel tank content is implemented by means of sensors (lever-type/tubular-type sensors), which either form one unit with the pump or are installed separately.

Lever-Type Sensors

Lever-Type sensor, in association with an electrical indicating device, are used for the measurement of the fuel level.

How they work

The liquid of the fuel level to be measured contains a floater, which rises or falls when the level changes and, by means of a lever, then causes a brush wiper spring to be moved on a resistance winding or a thick-film resistor. In both cases, an adaptation to the tank characteristics is implemented.

A resistance value, which corresponds to the liquid level, is set up. The value of the respective resistance is measured with an electrical indicating device and displayed in terms of fuel level values. With some transmitters the grounding is attached to the casing. Other transmitters are without grounding, i.e. the grounding is routed over a separate connection.

Lever-Type sensors can be additionally equipped with a warning contact, in order to signal the attaining of a filling level limit value (reserve), as well as for continuous measurement.

Tubular-Type Sensors

Immersion tubular-type sensors are also used for measurement of the fuel level, in association with an electrical indicating device.

How they work

The liquid of the fuel level to be measured contains a floater, which rises or falls when the level changes. Contact springs, which are attached to the floater, slide over two resistance wires running parallel to the floater movement and set up a resistance value which is proportional to the liquid level. The value of the respective resistance is measured with an electrical indicating device and displayed in terms of fuel level values.

The liquid to be monitored reaches the conduit through a flood boring. By this means, the inflow and outflow speed and the transmission of short-term variations of the liquid level to the floater contained in the conduit (e.g. due to in case of cornering or braking) is dampened.

With some transmitters the grounding is attached to the casing. Other transmitters are without grounding, i.e. the grounding is routed over a separate connection.

Tubular-type sensors can be additionally equipped with a warning contact, in order to signal the attaining of a filling level limit value (reserve), as well as for continuous measurement.
